

Clinic Queue & Patient Flow Management System

Problem Statement:

University clinics often experience long waiting times, inefficient patient flow management, poor emergency prioritization, and limited visibility into queue operations.

Proposed Solution:

The Clinic Queue & Patient Flow Management System is a web-based application designed to digitalize patient registration, automate queue prioritization, improve staff coordination, and enhance waiting room communication.

Key Features: Smart patient registration system Automated emergency and priority detection Live queue display board Staff queue management dashboard Patient search functionality Daily reporting and statistics **Target**

Users:

University clinics, small healthcare centres, and community medical facilities.

Expected Impact:

The system is expected to reduce patient waiting time, improve emergency response efficiency, streamline staff operations, and improve overall patient experience.

Technical Feasibility:

The solution was developed using HTML, CSS, and JavaScript, making deployment low-cost and accessible for small institutions with limited technical infrastructure.
