

Product Requirements Document (PRD)

Introduction

The Clinic Queue & Patient Flow Management System is designed to improve healthcare queue management within university clinics by automating patient registration and prioritization.

Problem Definition

Manual patient queue handling creates inefficiencies, delays, and difficulty managing emergency cases.

Objectives

Automate registration, improve queue prioritization, improve patient flow visibility, and support clinic staff operations.

Functional Requirements

Patient registration and queue assignment Automatic priority detection based on symptoms Emergency queue management Staff queue control system Patient search functionality Daily reporting dashboard

Non-Functional Requirements

Responsive user interface Fast queue updates Reliable system performance Simple and intuitive usability

Technology Stack

HTML5, CSS3, JavaScript, local browser state management.

Constraints

The current version does not include a backend database or cloud synchronization.

Future Enhancements

Cloud database integration SMS notifications AI symptom analysis Multi-clinic support
